

Project Design Phase

Proposed Solution Template

Date 30 September 2026

Team ID : SWTID-2026-3350

Project Name: PocketSmart AI – Your Smart Budget & Recommendation Assistant

Maximum Marks : 2 Marks

Proposed Solution Template:

The proposed solution for PocketSmart AI is designed to address the identified customer problems through a personalized, AI-assisted budgeting and recommendation web application. The solution combines income and expense tracking, budget analysis, personalized spending recommendations, and feedback-based recommendation updates in one workflow.

S.No.	Parameter	Description
1	1. Problem Statement (Problem to be solved)	Users need a simple and personalized way to understand their income, manage a budget, track expenses, and receive practical spending guidance. Generic budgeting approaches may not match an individual's income, spending patterns, financial priorities, or preferences, and users may not know how to adjust their budget or spending plan after reviewing their results.
2	2. Idea / Solution description	PocketSmart AI is a web-based smart budget assistant that collects user information such as income, budget amount, expenses, spending categories, and preferences. It analyzes the user's financial inputs and generates a personalized budget summary and AI-assisted spending recommendations using Google

		Gemini. The user can review the recommendations and submit feedback or updated information. The system then presents updated recommendations based on the available information.
3	3. Novelty / Uniqueness	The project combines AI-assisted budget analysis with a feedback loop. Instead of ending after the first recommendation, PocketSmart AI uses user feedback and updated financial information to support revised recommendations. The separate financial input, budget analysis, recommendation, feedback, and updated recommendation views organize the experience into a clear workflow.
4	4. Social Impact / Customer Satisfaction	PocketSmart AI can make basic budgeting and spending guidance easier to access and understand. Users receive financial summaries and personalized recommendations in one place and can communicate their experience through feedback. This can support a more user-centered budgeting experience and reduce the effort of manually reviewing expenses across multiple sources.
5	5. Business Model (Revenue Model)	A possible revenue model is freemium access: basic budget analysis and recommendation features can be available for free, while advanced personalization, extended financial history, detailed

		analytics, premium recommendation features, or additional AI assistance can be offered as paid features. The project prototype can demonstrate the core experience without requiring payment.
6	6. Scalability of the Solution	The solution can be expanded from a prototype to a larger personal finance platform by adding authentication, richer financial profiles, longer-term expense tracking, advanced analytics, mobile-friendly interfaces, additional AI models or services, cloud-based database storage, and integrations with supported financial or expense data sources. The modular FastAPI backend and template-based frontend provide a foundation for adding these capabilities.

PocketSmart AI Solution Flow

User Financial Input → Budget & Expense Analysis → AI-Personalized Recommendations → Feedback / Updated Information → Updated Recommendations
